Located in the heart of Tennessee, this 10-mile section of I-24 in Coffee County runs from mile marker 107 to 117, helping to connect Nashville to Chattanooga.

I-24 was constructed in 1966 with 8 inches of crushed stone base, 7 inches of bituminous base mix, 3.5 inches of HMA binder mix, 1 inch of leveling course and 1 inch of surface course. The road received a 3.25-inch HMA overlay in 1990. In 2001, 1.25 inches of the road were milled and replaced with a 1.25-inch HMA overlay.

Since opening to traffic, the Interstate has withstood approximately 22 million ESALs without any signs of structural failure, fatigue, or bottom-up cracking. This is despite the fact that the climate in the area subjects the pavement to numerous freeze-thaw cycles and an average yearly rainfall of 56.8 inches.
